

SPRING BULBS

GROUND LEVEL

TO PREPARE GARDEN SOIL:

Make soil in garden, rich and light by mixing in sharp sand, compost (bark soil or rotten manure) and bonemeal. **SOAK BULBS WELL AFTER PLANTING.** After bulbs are well up, work in fertilizer 6-8-6 to ensure good growth.

When well rooted and sprouted, transplant to a 4" pot or 3 pendulous tubers to a 10" hanging basket

Fertilize (Knapp's Plant Starter) and water from the bottom, only in the early morning, when required. When transplanting to the garden, plant level with top of soil and 12" apart. **SOAK WELL AFTER PLANTING.**

TUBEROUS BEGONIAS

LEAVE 2 STRONG SPROUTS FOR BEST FLOWERING RESULTS

10" HANGING BASKET

Pendulous Tubers are used for hanging baskets. Start bulbs in a tray of dampened peat moss or mica peat at a temperature of 65° - 70° F. Water **CAREFULLY.** Avoid decay by drying centre of tuber with a blotter or cloth.

PEONY

Prepare soil according to instructions. It is important to make a large hole as the peony develops a large root. **CAREFUL** that the eyes of tubers are no deeper than 2", deeper planting may

prevent blooming. Keep manures from coming in direct contact with the roots. Support stocks with a peony ring.

TO CONTROL BOTRYTIS, which browns buds and spots leaves, cut out and burn all infected parts. **SPRAY COPPER FUNGICIDE**

SPRAY before new buds open. Help prevent Botrytis by spraying captan as soon as leaves appear.

ROOTS MUST NOT SETTLE AFTER PLANTING—CAREFULLY FIRM SOIL AROUND ROOTS

SOAK LOWER SOIL WITH WATER—ALLOW TO SETTLE WELL BEFORE PLANTING

GLADIOLUS

Prepare garden soil according to instructions

Plant only when soil is warm

IMPORTANT Use a bulb dust on bulbs to control insects and diseases

Prepare garden soil according to instructions. When preparing the soil, add 1/4 cup Bonemeal per tuber to ensure better growth and flowers.

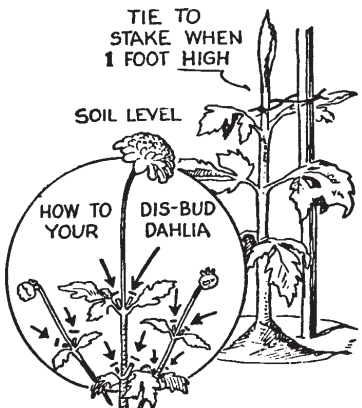

After planting **SOAK WELL** and not again until shoots appear above the ground unless there is a long, hot dry spell.

Dis-bud your dahlia when each stock has formed 3 sets of leaves. This produces a bushy and profusely flowered plant.

MULCH with bark mulch around the plants to help keep soil evenly moist, and to reduce weeds.

Keep the flowers picked regularly and do not water plants overhead.

Fertilize using Knapp's 4-10-10
